(54) Title: PYRAZOLOPYRIMIDINONE cGMP PDE5 INHIBITORS FOR THE TREATMENT OF SEXUAL DYSFUNCTION

(IA)

(IB)

(57) Abstract

There is provided compounds of formula (IA) and of formula (IB), wherein R¹, R², R³, R⁴ and A have meanings given in the description, which are useful in the curative and prophylactic treatment of medical conditions for which inhibition of a cyclic guanosine 3',5'-monophosphate phosphodiesterase (e.g. cGMP PDE5) is desired.

**PYRAZOLOPYRIMIDINONE cGMP PDE5 INHIBITORS FOR THE
TREATMENT OF SEXUAL DYSFUNCTION**

Field of the Invention

5

This invention relates to pharmaceutically useful compounds, in particular compounds which are useful in the inhibition of cyclic guanosine 3',5'-monophosphate phosphodiesterases (cGMP PDEs), such as type 5 cyclic guanosine 3',5'-monophosphate phosphodiesterases (cGMP PDE5). The
10 compounds therefore have utility in a variety of therapeutic areas, including male erectile dysfunction (MED).

Prior Art

15 International patent application WO 94/28902 discloses the use of certain pyrazolopyrimidinone compounds in the treatment of impotence.

Disclosure of the Invention

20 According to a first aspect of the invention there is provided compounds of formulae IA and IB:

IA

IB

wherein

A represents CH or N;

- 5 R^1 represents H, lower alkyl, Het, alkylHet, aryl or alkylaryl, which latter five groups are all optionally substituted (and/or, in the case of lower alkyl, optionally terminated) by one or more substituents selected from halo, cyano, nitro, lower alkyl, OR^5 , $C(O)R^6$, $C(O)OR^7$, $C(O)NR^8R^9$, $NR^{10a}R^{10b}$ and $SO_2NR^{11a}R^{11b}$;
- 10 R^2 represents $C(O)NR^{12}R^{13}$, $C(O)OR^{12}$, $NR^{12}R^{13}$, $N(H)SO_2R^{12}$, $N(H)SO_2NR^{12}R^{13}$, $N(H)C(O)R^{12}$, OR^{12a} , lower alkyl (which alkyl group is interrupted by one or more of O, S or $N(R^{12})$ and/or substituted or terminated by $C(O)NR^{12}R^{13}$, $C(O)OR^{12}$ or aryl or Het¹), cyano, aryl or Het¹;
- 15 R^3 , R^{12} and R^{13} independently represent H or lower alkyl, which alkyl group is optionally substituted and/or optionally terminated by one or more substituents selected from aryl, Het, halo, cyano, nitro, OR^5 , $C(O)R^6$, $C(O)OR^7$, $C(O)NR^8R^9$, $NR^{10a}R^{10b}$ and $SO_2NR^{11a}R^{11b}$;
- R^4 represents $SO_2NR^{14}R^{15}$;
- 20 R^{14} and R^{15} , together with the nitrogen to which they are attached, form Het;

Het represents an optionally substituted four- to twelve-membered heterocyclic group, which group contains at least one nitrogen atom and, optionally, one or more further heteroatoms selected from nitrogen, oxygen and sulphur;

- 5 Het¹ represents an optionally substituted four- to twelve-membered heterocyclic group, which group contains at least one nitrogen atom or at least one oxygen atom and, optionally, one or more further heteroatoms selected from nitrogen, oxygen and sulphur; and
- R⁵, R⁶, R⁷, R⁸, R⁹, R^{11a}, R^{11b} and R^{12a} independently represent, at each
10 occurrence when used herein, H or lower alkyl;
- R^{10a} and R^{10b}, at each occurrence when used herein, either independently represent, H or lower alkyl or, together with the nitrogen atom to which they are attached, represent azetidiny, pyrrolidinyl or piperidinyl; or a pharmaceutically, or a veterinarily, acceptable derivative thereof;
- 15 which compounds are referred to together hereinafter as "the compounds of the invention".

The term "aryl", when used herein, includes six- to ten-membered carbocyclic aromatic groups, such as phenyl and naphthyl. Each "aryl"
20 group identified herein is optionally substituted with one or more substituents selected from halo, cyano, nitro, lower alkyl, OR⁵, C(O)R⁶, C(O)OR⁷, C(O)NR⁸R⁹, NR^{10a}R^{10b}, SO₂NR^{11a}R^{11b} and N(H)SO₂R¹².

The terms "Het" and "Het¹", when used herein, include four- to twelve-
25 membered, preferably four- to ten-membered, ring systems, which may be wholly or partly aromatic in character. Each "Het/Het¹" group identified herein is optionally substituted with one or more substituents selected from halo, cyano, nitro, lower alkyl (which alkyl groups may itself be

optionally substituted or terminated as defined below), OR^5 , $C(O)R^6$, $C(O)OR^7$, $C(O)NR^8R^9$, $NR^{10a}R^{10b}$, $SO_2NR^{11a}R^{11b}$ and $N(H)SO_2R^{12}$. The term thus includes groups such as optionally substituted azetidiny, pyrrolidinyl, imidazolyl, indolyl, oxadiazolyl, thiadiazolyl, triazolyl, tetrazolyl, oxatriazolyl, thiatriazolyl, pyridazinyl, morpholinyl, pyrimidinyl, pyrazinyl, pyridinyl, quinolinyl, isoquinolinyl, piperidinyl, benzodioxalyl, pyrazolyl, imidazopyridinyl, furanyl, tetrahydrofuranyl and piperazinyl, e.g. 4- R^{16} -piperazinyl, wherein R^{16} represents H or lower alkyl, which latter group is optionally substituted or terminated by one or more substituents selected from aryl, Het, halo, cyano, nitro, OR^5 , $C(O)R^6$, $C(O)OR^7$, $C(O)NR^8R^9$, $NR^{10a}R^{10b}$, $SO_2NR^{11a}R^{11b}$ and $N(H)SO_2R^{12}$.

"Het" and "Het¹" groups may also be in the form of an N-oxide.

Azetidinyl, pyrrolidinyl and piperidinyl groups that R^{10a} , R^{10b} and the nitrogen atom to which they are attached may together represent may also be substituted with one or more substituents selected from halo, cyano, nitro, lower alkyl (which alkyl groups may itself be optionally substituted or terminated as defined below), OR^5 , $C(O)R^6$, $C(O)OR^7$, $C(O)NR^8R^9$, $NR^{10a}R^{10b}$, $SO_2NR^{11a}R^{11b}$ and $N(H)SO_2R^{12}$.

For the avoidance of doubt, the nitrogen atom to which R^{14} and R^{15} are attached is the nitrogen atom that must be present in the relevant Het group.

The term "lower alkyl", when used herein, includes C_{1-6} alkyl. Alkyl groups which R^1 , R^2 , R^3 , R^5 , R^6 , R^7 , R^8 , R^9 , R^{10a} , R^{10b} , R^{11a} , R^{11b} , R^{12} ,

R^{12a} , R^{13} and R^{16} may represent, and with which R^1 , $NR^{10a}R^{10b}$, aryl, Het and Het¹ may be substituted, may, when there is a sufficient number of carbon atoms, be linear or branched, be saturated or unsaturated, be cyclic, acyclic or part cyclic/acyclic, be interrupted by oxygen, and/or be substituted by one or more halo atom.

The terms "alkylHet" and "alkylaryl" include C_{1-6} alkylHet and C_{1-6} alkylaryl. The alkyl groups (e.g. the C_{1-6} alkyl groups) of alkylHet and alkylaryl may, when there is a sufficient number of carbon atoms, be linear or branched, be saturated or unsaturated, and/or be interrupted by oxygen. When used in this context, the terms "Het" and "aryl" are as defined hereinbefore.

Halo groups, with which R^1 , R^3 , R^{12} , R^{13} , R^{16} , aryl, Het, Het¹ and above-mentioned alkyl groups may be substituted or terminated, include fluoro, chloro, bromo and iodo.

The term "pharmaceutically, and veterinarily, acceptable derivative" includes salts and solvates. Salts which may be mentioned include: acid addition salts, for example, salts formed with inorganic acids such as hydrochloric, hydrobromic, sulphuric and phosphoric acid, with carboxylic acids or with organo-sulphonic acids; base addition salts; metal salts formed with bases, for example, the sodium and potassium salts. Pharmaceutically acceptable derivatives also include C_1 to C_4 alkyl ammonium salts.

Preferred compounds of the invention include those wherein:

R¹ represents H, a linear, branched, cyclic, acyclic and/or part cyclic/acyclic lower alkyl group, alkylHet, or alkylaryl;

R² represents a linear or branched, optionally unsaturated lower alkyl group (which alkyl group is optionally interrupted by one or more of O, S or N(R¹²)), C(O)NR¹²R¹³, NR¹²R¹³, N(H)C(O)R¹², OR^{12a}, aryl or Het¹;

R³ represents linear, branched, cyclic and/or acyclic lower alkyl which is optionally substituted or terminated by one or more substituents selected from Het or OR⁵;

R¹² and R¹³ independently represent H, or linear or branched lower alkyl, provided that, in the case where R² represents NR¹²R¹³, R¹² and R¹³ do not both represent H;

R¹⁴ and R¹⁵, together with the nitrogen to which they are attached represent 4-R¹⁶-piperazinyl, in which R¹⁶ is as hereinbefore defined.

More preferred compounds of the invention include those wherein:

R¹ represents H; a linear or part cyclic/acyclic C₁-C₆ alkyl group; C₁-C₂ alkylphenyl, the phenyl group of which is optionally substituted by one or more halo atoms; or C₁-C₃ alkylHet, in which Het represents a six-membered heterocyclic group;

R² represents a linear or branched, optionally unsaturated, C₁₋₆ alkyl group (which alkyl group is optionally interrupted by one or more of O or N(R¹²)), C(O)NR¹²R¹³, NR¹²R¹³, N(H)C(O)R¹², OR^{12a}, an optionally substituted phenyl group, or an optionally substituted Het¹ group (e.g. a pyridinyl, benzodioxazolyl, furanyl, tetrahydrofuranyl, imidazolopyridinyl, pyrazolyl, oxadiazolyl pyrimidinyl or pyrazinyl group);

- R^3 represents linear or branched C_1 - C_4 alkyl, which is optionally terminated by one or more substituents selected from pyridinyl or OR^5 , in which R^5 represents H or C_1 - C_3 alkyl;
- R^{12} and R^{13} independently represent H or linear or branched C_1 - C_3 alkyl, provided that, in the case where R^2 represents $NR^{12}R^{13}$, R^{12} and R^{13} do not both represent H;
- R^{12a} represents C_{1-3} alkyl;
- R^{14} and R^{15} , together with the nitrogen to which they are attached, represent 4- R^{16} -piperazinyl, in which R^{16} represents a linear or branched C_1 - C_3 alkyl group which is optionally terminated by OH.

- Particularly preferred compounds of the invention include those wherein:
- R^1 represents H, a linear or part cyclic C_1 - C_5 alkyl group (e.g. methyl, ethyl, propyl or cyclobutylmethyl), CH_2 phenyl, CH_2 (bromophenyl) (e.g. CH_2 (4-bromophenyl)), C_1 - C_2 alkylHet, in which Het represents pyridin-2-yl, pyridin-3-yl, pyridin-4-yl, pyrimidin-2-yl or morpolin-4-yl;
- R^2 represents a linear or branched, optionally unsaturated, C_{1-4} alkyl group (which alkyl group is optionally interrupted by an oxygen atom or an $N(R^{12})$ group), $C(O)NR^{12}R^{13}$, $NR^{12}R^{13}$, $N(H)C(O)R^{12}$, OR^{12a} , phenyl (optionally substituted by one or more substituent (e.g. one or more of C_{1-3} alkyl, C_{1-3} alkoxy (which latter two groups are optionally substituted by one or more halo atom and/or optionally interrupted by an oxygen atom), halo and cyano)), pyridin-2-yl, pyridin-3-yl, pyrimidin-5-yl, pyrazin-2-yl (which latter four groups are optionally substituted (e.g. by one or more halo, C_{1-3} alkyl, C_{1-3} alkoxy or $NR^{10a}R^{10b}$ groups)), furan-2-yl, furan-3-yl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, benzodioxalyl, imidazolo[1,2-a]pyridin-6-yl (which latter six groups are optionally substituted), pyrazol-

4-yl or 1,3,4-oxadiazol-2-yl (which latter two groups are optionally substituted (e.g. by one or more C₁₋₃ alkyl groups));

R³ represents C₂-C₄ alkyl optionally terminated with OC₁-C₂ alkyl or pyridin-2-yl;

- 5 R^{10a} and R^{10b} independently represent H or C₁₋₂ alkyl or, together with the nitrogen atom to which they are attached, represent azetidiny;

R¹² and R¹³ independently represent H, methyl or ethyl, provided that, in the case where R² represents NR¹²R¹³, R¹² and R¹³ do not both represent H;

- 10 R^{12a} represents methyl or ethyl;

R¹⁴ and R¹⁵, together with the nitrogen to which they are attached represent 4-R¹⁶-piperazinyl, in which R¹⁶ represents methyl or ethyl, the latter of which is optionally terminated with OH.

- 15 Most preferred compounds of the invention include the compounds of the Examples described hereinafter.

According to a further aspect of the invention there is provided a compound of formula IA or IB as hereinbefore defined, provided that:

- 20 (a) R² does not represent OR^{12a} or lower alkyl substituted or terminated by Het¹;
- (b) Het¹ represents Het;
- (c) R^{10a} and R^{10b} do not, together with the nitrogen atom to which they are attached, represent azetidiny, pyrrolidinyl or piperidinyl;
- 25 (d) alkyl groups, as defined herein, are not substituted by one or more halo atom.

The compounds of the invention may exhibit tautomerism. All tautomeric forms of the compounds of formulae IA and IB, and mixtures thereof, are included within the scope of the invention.

- 5 The compounds of the invention may also contain one or more asymmetric carbon atoms and may therefore exhibit optical and/or diastereoisomerism. Diastereoisomers may be separated using conventional techniques e.g. by fractional crystallisation or chromatography. The various stereoisomers may be isolated by separation of a racemic or other mixture of the
- 10 compounds using conventional techniques e.g. fractional crystallisation or HPLC. The desired optical isomers may be prepared by reaction of the appropriate optically active starting materials under conditions which will not cause racemisation or epimerisation. Alternatively, the desired optical isomers may be prepared by resolution, either by HPLC of the racemate
- 15 using a suitable chiral support or, where appropriate, by fractional crystallisation of the diastereoisomeric salts formed by reaction of the racemate with a suitable optically active acid or base. All stereoisomers are included within the scope of the invention.
- 20 Also included within the scope of the invention are radiolabelled derivatives of compounds of formulae IA and IB which are suitable for biological studies.

Preparation

25

According to a further aspect of the invention there is provided processes for the preparation of compounds of the invention, as illustrated below.

The following processes are illustrative of the general synthetic procedures which may be adopted in order to obtain the compounds of the invention:

1. Compounds of formulae IA and IB may be prepared by cyclisation
5 of corresponding compounds of formulae IIA and IIB, respectively:

IIA

IIB

wherein R^1 , R^2 , R^3 , R^4 and A are as defined previously for compounds of formulae IA and IB.

- 10 This cyclisation may be accomplished under basic, neutral or acidic conditions using known methods for pyrimidone ring formation. Preferably, the cyclisation is performed under basic conditions using an alkali metal salt of an alcohol or amine, such as potassium tert-butoxide or potassium bis(trimethylsilyl) amide, in the presence of a suitable solvent
15 (e.g. an alcohol), for example at elevated (e.g. reflux) temperature (or, if a sealed vessel is employed, at above reflux temperature). The skilled person will appreciate that, when an alcohol is selected as solvent, an appropriate alcohol of formula R^3OH , or a sterically hindered alcohol, e.g. iso-propanol or 3-methyl pentan-3-ol, may be used if it is intended to
20 mitigate alkoxide exchange at either the 2-position of the pyridin-3-yl, or the phenyl, substituent.

Compounds of formulae IIA and IIB may be prepared by reaction of corresponding compounds of formulae IIIA and IIIB, respectively:

IIIA

IIIB

wherein R¹ and R² are as defined previously for compounds of formulae IIA and IIB, with a compound of formula IV or a carboxylic acid derivative thereof:

IV

wherein R³, R⁴ and A are as defined previously for compounds of formulae IIA and IIB.

This coupling reaction may be achieved by conventional amide bond forming techniques which are well known to those skilled in the art. For example, an acyl halide (e.g. chloride) derivative of a compound of formula IV may be reacted with a compound of formula IIIA or IIIB in the presence of an excess of a tertiary amine, such as triethylamine or pyridine, optionally in the presence of a suitable catalyst, such as 4-

dimethylaminopyridine, in a suitable solvent such as dichloromethane, at a temperature of about 0°C to room temperature.

A variety of other amino acid coupling methodologies may be used to couple the compound of formula IIIA or IIIB with the compound of formula IV. For example, the acid of formula IV or a suitable salt thereof (e.g. sodium salt) may be activated with an appropriate activating reagent, e.g. a carbodiimide, such as 1,3-dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride optionally in the presence of 1-hydroxybenzotriazole hydrate and/or a catalyst such as 4-dimethylaminopyridine; a halotrisaminophosphonium salt such as bromotris(pyrrolidino)phosphonium hexafluorophosphate; or a suitable pyridinium salt such as 2-chloro-1-methyl pyridinium chloride. Either type of coupling reaction may be conducted in a suitable solvent such as dichloromethane or tetrahydrofuran, optionally in the presence of a tertiary amine such as N-methylmorpholine or N-ethyldiisopropylamine (for example when either the compound of formula IIIA or IIIB, or the activating agent is presented in the form of an acid addition salt), at from about 0°C to about room temperature. Preferably, from about 1 to 2 molecular equivalents of the activating reagent and from 1 to 3 molecular equivalents of any tertiary amine present may be employed.

Alternatively, the carboxylic acid function of IV may be activated using an excess of a reagent such as N,N'-carbonyldiimidazole in an appropriate solvent, e.g. ethyl acetate, dichloromethane or butan-2-one, at from about room temperature to about 80°C, followed by reaction of the intermediate imidazolide with a compound of the formula IIIA or IIIB at from about 20°C to about 90°C.

In a further variation, a compound of formula IA or IB in which A is CH may be formed in a one-pot procedure by coupling a compound of formula IIIA or IIIB with an acyl chloride derivative of a compound of formula IV and by cyclising the resultant intermediate compound of formula IIA or IIB, using the methods as described previously. The one-pot procedure may further involve an *in-situ* coupling and cyclisation reaction to form a compound of formula IA or IB. Preferably, pyridine may serve as an acid scavenger and as the solvent for the *in-situ* coupling and cyclisation reaction.

2. Compounds of formulae IA and IB, in which R^2 represents $C(O)NR^{12}R^{13}$, and R^{12} and R^{13} are as defined previously for compounds of formulae IA and IB, may be prepared by reaction of corresponding compounds of formulae IA and IB, in which R^2 represents $C(O)OH$ (or a carboxylic acid derivative thereof) with a compound of formula $HNR^{12}R^{13}$, in which R^{12} and R^{13} are as previously defined for compounds of formulae IA and IB.

This reaction may be accomplished using analogous amide bond forming techniques to those previously described for compounds of formulae IIA and IIB. Alternatively, when R^{12} and R^{13} both represent hydrogen and A represents CH, the coupling reaction may be performed by reaction with ammonia in methanol, at 100° C under pressure.

3. Compounds of formulae IA and IB, in which R^2 represents $C(O)OR^{12}$, may be prepared by cyclisation of corresponding compounds of formulae VIA and VIB, respectively:

VIA

VIB

wherein R^1 , R^3 , R^4 and A are as defined previously for compounds of formulae IA and IB, and R^{12alk} represents an optionally substituted lower alkyl group, as defined hereinbefore, followed by removal of the alkyl group R^{12alk} (if required) by hydrolysis and/or (if required) exchange with a further optionally substituted alkyl group.

Typically, the cyclisation reaction is accomplished using analogous methods to those previously described for compounds of formulae IIA and IIB.

Compounds of formulae VIA and VIB may be prepared by reaction of corresponding compounds of formulae VIIA and VIIB, respectively:

VIIA

VIIB

wherein R^1 and R^{12alk} are as defined previously for compounds of formulae VIA and VIB, with a compound of formula IV as defined hereinbefore.

The reaction may be accomplished using analogous amide coupling conditions to those described previously in relation to compounds of formulae IIA and IIB.

4. Compounds of formulae IA and IB may alternatively be prepared by reaction of corresponding compounds of formulae VIIIA and VIIIB, respectively:

VIIIA

VIIIB

wherein Y is a leaving group, such as halo, preferably chloro, bromo or iodo, and R¹, R², R³ and A are as previously defined for compounds of formulae IA and IB, with a compound of formula IX:

wherein R¹⁴ and R¹⁵ are as previously defined for compounds of formulae IA and IB.

This reaction is typically performed at from 0°C to room temperature, in the presence of an appropriate solvent, such as a C₁ to C₃ alcohol or dichloromethane, using an excess of the compound of formula IX and, optionally, in the presence of another suitable base, such as triethylamine.

Compounds of formula VIIIA and VIIIB, in which A represents N, may be prepared from corresponding compounds of formulae XA and XB, respectively:

5

XA

XB

wherein R^1 , R^2 and R^3 are as previously defined for compounds of formulae VIIIA and VIIIB, using methods known to those skilled in the art for converting an amino group to an SO_2Y group, in which Y is as previously defined for compounds of formulae VIIIA and VIIIB. For example, compounds of formulae VIIIA and VIIIB in which Y is chloro may be prepared by reacting a corresponding compound of formula XA or XB with about a 1.5 to 2-fold excess of sodium nitrite in a mixture of concentrated hydrochloric acid and glacial acetic acid, at from about -25°C to about 0°C , followed by treatment with excess liquid sulphur dioxide and a solution of about a three-fold excess of cupric chloride in aqueous acetic acid, at from about -30°C (e.g. -15°C) to about room temperature.

20

Compounds of formulae XA and XB may be prepared by cyclisation of corresponding compounds of formulae XIA and XIB, respectively:

XIA

XIB

wherein R^1 , R^2 and R^3 are as previously defined for compounds of formulae XA and XB. This cyclisation may be carried out using similar techniques to those described hereinbefore for the preparation of compounds of formulae IIA and IIB, but it is preferably base mediated.

Compounds of formulae XIA and XIB may be prepared by the reduction of corresponding compounds of formulae XIIA and XIIB, respectively:

XIIA

XIIB

wherein R^1 , R^2 and R^3 are as defined previously for compounds of formulae XIA and XIB, by conventional techniques, such as catalytic hydrogenation. Typically, the hydrogenation may be achieved using a Raney nickel catalyst in a suitable solvent such as ethanol at a hydrogen pressure of about 150kPa to 500kPa, especially 345kPa, at from about 40°C to about 50°C.

Compounds of formulae XIIA and XIIB may be prepared by reaction of corresponding compounds of formulae IIIA and IIIB as defined hereinbefore, with a compound of formula XIII:

XIII

wherein R³ is as previously defined for compounds of formulae XIIA and XIIB. The reaction may be achieved using analogous amide bond forming techniques to those previously described for compounds of formulae IIA and IIB.

Compounds of formulae XA and XB may alternatively be prepared by reduction of corresponding compounds of formulae XIII A and XIII B, respectively:

XIII A

XIII B

wherein R¹, R² and R³ are as previously defined for compounds of formulae XA and XB. This reduction may be performed under a variety of reaction conditions, for example by catalytic hydrogenation (e.g. using

10% Pd/C in an alcohol, such as ethanol, at 60 psi (415 kPa) H₂ pressure and room temperature) or by transition metal catalysed reduction (e.g. at around room temperature in the presence of iron powder (e.g. 7 eq.) in acetic acid, or TiCl₃ (e.g. 9 eq.) in acetic acid).

5

Compounds of formulae XIII A and XIII B may be prepared by reaction of a compound of formula XIII C,

XIII C

10

or, preferably, a carboxylic acid addition salt thereof, wherein R³ is as previously defined for compounds of formulae XIII A and XIII B, with either:

- (a) a corresponding compound of formula III A or formula III B, as defined
15 hereinbefore; or
- (b) a corresponding compound of formula XVII A or formula XVII B, as defined hereinafter,

in both cases under conditions such as those described herein. Such reactions may be carried out, for example, using 1.0 to 1.1 equivalents of
20 the amidine compound of formula XIII C, for example by refluxing in 3-methyl-3-pentanol.

Compounds of formula XIII C may be prepared from the corresponding cyanopyridine under conditions well known to those skilled in the art.

Compounds of formulae XIII A and XIII B in which R^2 represents lower alkyl (which alkyl group is branched and unsaturated at the carbon atom that is attached to the rest of the molecule), $NR^{12}R^{13}$, cyano, aryl or Het^1 (which Het^1 group is either aromatic or is unsaturated at the carbon atom that is attached to the rest of the molecule) may alternatively be prepared from corresponding compounds of formulae XIID or XIIE, respectively:

XIIID

XIIIE

wherein Hal represents Cl , Br or I , preferably I and especially Br , and R^1 and R^3 are as previously defined for compounds of formulae XIII A and XIII B, for example as described hereinafter for preparation of compounds of formulae IA and IB (see process 6 below). In addition to the process conditions described in process 6 below, suitable coupling conditions include so-called "Suzuki" conditions (e.g. 1.2 eq. of boronic acid, 2 eq. of K_2CO_3 and 0.1 eq. of $Pd(PPh_3)_4$, refluxing in an approximately 4:1 mixture of dioxane:water, or 2.5 to 3 eq. of CsF , 0.05 to 0.1 eq. of $Pd_2(dba)_3$ and 0.01 to 0.04 eq of $P(o-tol)_3$, refluxing in DME); or so-called "Stille" conditions (1.5 eq. of stannane, 10 eq. of $LiCl$, 0.15 eq. of CuI , and 0.1 eq. of $Pd(PPh_3)_4$, refluxing in dioxane, or 5 eq. of stannane, 3.6 eq. of Et_3N , $Pd_2(dba)_3$ and $P(o-tol)_3$, refluxing in $MeCN$).

Compounds of formula XIII D and XIII E may be prepared by halogenation of corresponding compounds of formulae XIIF and XIIG, respectively:

XIII F

XIII G

wherein R^1 and R^3 are as hereinbefore defined, under conditions known to those skilled in the art (e.g., for bromination, at between room temperature and reflux in the presence of acetic acid as solvent, 1.5 to 2.0 eq. of bromine and e.g. 1.5 to 2.0 eq. of sodium acetate).

Compounds of formulae VIIIA and VIIIB, in which A is CH, may be prepared from corresponding compounds of formulae XIVA and XIVB, respectively:

XIVA

XIVB

wherein R^1 , R^2 and R^3 are as previously defined for compounds of formulae VIIIA and VIIIB, for example using conventional methods for the introduction of a SO_2Y group into an aromatic ring system, such as reaction of a compound of formula XIVA and XIVB with a compound of formula SO_2Y and/or a compound of formula YSO_3H . When Y is chloro,

an excess of chlorosulphonic acid, optionally with an excess of thionyl chloride, at from about 0°C to room temperature may be used in an appropriate organic solvent (e.g. dichloromethane).

- 5 Compounds of formulae XIVA and XIVB are available using known techniques. For example, compounds of formulae XIVA and XIVB, in which R¹ represents lower alkyl, alkylHet or alkylaryl, may be prepared by alkylation of corresponding compounds of formulae XVA and XVB, respectively:

10

XVA

XVB

- wherein R² and R³ are as previously defined for compounds of formulae XIVA and XIVB, using methods which are well known to those skilled in the art. For example, the reaction may be accomplished by reaction of a compound formula XVA or XVB with a compound of formula R¹L¹, wherein R¹ represents lower alkyl, alkylHet or alkylaryl, and L¹ is a suitable leaving group, using conventional techniques which are well known to those skilled in the art. Preferably, the leaving group is halo (preferably chloro, bromo or iodo) and the alkylation is performed in the presence of an appropriate base (e.g. sodium hydride), in an appropriate solvent (e.g. dimethylformamide), optionally in the presence of sodium iodide or potassium iodide, at from about -70°C to about 100°C.

Preferably the alkylation is conducted at from about room temperature to about 80°C. Alternatively, compounds of formulae XVA and XVB may be reacted with a compound of formula R¹OH, wherein R¹ represents lower alkyl, alkylHet or alkylaryl, using classical Mitsunobu
5 methodology.

Compounds of formulae XIVA and XIVB may alternatively be prepared by cyclisation of corresponding compounds of formulae XVIA and XVIB, respectively:

10

XVIA

XVIB

wherein R¹, R² and R³ are as previously defined for compounds of formulae XIVA and XIVB. The cyclisation may be accomplished using
15 analogous conditions to those described previously for compounds of formula IIA and IIB.

Compounds of formulae XVIA and XVIB may be prepared by coupling corresponding compounds of formulae XVIIA and XVIIIB, respectively:

XVIIA

XVIIIB

wherein R^1 and R^2 are as previously defined for compounds of formulae XVIIA and XVIIIB and R^{17} represents a lower (e.g. C_{1-6} alkyl) group, with a compound of formula XVIII or a carboxylic acid derivative thereof:

XVIII

wherein R^3 is as previously defined for compounds of formulae XVIIA and XVIIIB, followed by conversion of the $C(O)OR^{17}$ group of the resultant amide into $C(O)NH_2$ using conventional techniques known to those skilled in the art. In a particular embodiment, the *in-situ* conversion of the $C(O)OR^{17}$ group of compounds of formulae XVIIA and XVIIIB into a $C(O)NH_2$ group, and the cyclisation of the intermediate formed from the coupling, may be accomplished in a one-pot procedure. Preferably, this one-pot procedure is accomplished with a saturated methanolic ammonia solution, in the presence of base (e.g. potassium *t*-butoxide), under pressure, at elevated temperatures, especially at 100°C .

Compounds of formulae XIVA and XIVB, in which R^2 represents $C(O)NH_2$, may alternatively be prepared by reaction of corresponding compounds of formulae XIXA and XIXB, respectively:

XIXA

XIXB

wherein R^1 and R^3 are as previously defined for compounds of formulae
 XIVA and XIVB and R^{17} is as previously defined for compounds of
 formulae XVIIA and XVIIIB, with ammonia, followed by cyclisation of
 5 the resultant intermediate using similar techniques to those described
 hereinbefore.

Preferably, the reaction is accomplished in a saturated methanolic
 ammonia solution, in a sealed vessel, at elevated temperatures, e.g.
 10 100°C. The cyclisation of the resultant intermediate may be accomplished
 using analogous techniques to those previously described for preparation
 of compounds of formulae IA and IB from compounds of formulae IIA
 and IIB. In a particular embodiment, the *in-situ* conversion of the
 $C(O)OR^{17}$ group, and the cyclisation, may be accomplished in a one-pot
 15 procedure.

Compounds of formula XIXA and XIXB may be prepared by reaction of
 corresponding compounds of formulae XXA and XXB, respectively:

XXA

XXB

wherein R^1 and R^{17} are as previously defined for formulae XIXA and
 5 XIXB, with a compound of formula XVIII as defined hereinbefore. The
 coupling reaction may be performed using analogous conditions to those
 previously described for compounds of preparation of compounds of
 formulae IIA and IIB.

10 Compounds of formulae XIVA and XIVB, in which R^2 represents
 $C(O)NR^{12}R^{13}$, may alternatively be prepared by cyclisation of
 corresponding compounds of formulae XXIA and XXIB, respectively:

XXIA

XXIB

wherein R^1 and R^3 are as previously defined for compounds of formulae
 15 XIVA and XIVB and R^{17} is as previously defined for formulae XVIIA and
 XVIIIB, followed by conversion of the $C(O)OR^{17}$ group of the resultant
 intermediate into an $C(O)NR^{12}R^{13}$ group, in which R^{12} and R^{13} are as
 previously defined for compounds of formulae IA and IB.

The cyclisation may be accomplished using analogous cyclisation techniques to those previously described for formulae IIA and IIB. The conversion of $C(O)OR^{17}$ group into $C(O)NR^{12}R^{13}$ may be accomplished
5 using techniques which are known to those skilled in the art. Typically, the reaction is accomplished by removal of R^{17} and then reacting the resultant acid (or derivative, e.g. alkali metal salt, if formed by the removal reaction) with a compound of formula $HNR^{12}R^{13}$, in which R^{12} and R^{13} are as previously defined for formulae IA and IB, using analogous
10 amide coupling techniques to those described hereinbefore for compounds of formulae IIA and IIB. It will be appreciated that by an appropriate selection of the protecting group R^{17} , it may be removed during the reaction of the product formed from the cyclisation of compounds of formulae XXIA and XXIB.

15

In a further embodiment, compounds of formulae XIVA and XIVB, in which R^2 represents $C(O)NR^{12}R^{13}$, and R^{12} and R^{13} are as defined hereinbefore for compounds of formulae IA and IB, except that they do not represent H, may be prepared from corresponding compounds of
20 formula XIVA and XIVB, in which R^2 represents $C(O)NH_2$.

This conversion may be accomplished using procedures which are known to those skilled in the art. For example, the $CONH_2$ group may be hydrolysed into the corresponding acid (or acid salt) group, which may
25 then be coupled to a compound of formula $HNR^{12}R^{13}$ using analogous amide bond forming techniques to those previously described for compounds of formulae IIA and IIB. Preferably, the hydrolysis is

performed under basic conditions e.g. using aqueous sodium hydroxide in ethanol or dioxan, at reflux temperature of the reaction.

- 5 5. Compounds of formulae IA and IB in which R^1 represents lower alkyl, alkylHet or alkylaryl may be prepared by alkylation of corresponding compounds of formulae XXIIA and XXIIB, respectively:

XXIIA

XXIIB

- wherein R^2 , R^3 , R^4 and A are as previously defined for compounds of formulae IA and IB, for example as described hereinbefore for preparation
 10 of compounds of formulae XIVA and XIVB. The skilled person will appreciate that compounds of formulae XXIIA and XXIIB are, respectively, compounds of formulae IA and IB in which R^1 represents H.

6. Compounds of formulae IA and IB, in which R^2 represents lower alkyl
 15 (which alkyl group is branched and unsaturated at the carbon atom that is attached to the rest of the molecule), $NR^{12}R^{13}$, cyano, aryl or Het¹ (which Het¹ group is either aromatic or unsaturated at the carbon atom that is attached to the rest of the molecule), may be prepared by cross-coupling of corresponding compounds of formula XXIIIA and XXIIIB:

XXIIIA

XXIIIB

wherein Hal, R¹, R³, R⁴ and A are as hereinbefore defined, using a compound of formula

- 5 wherein R^{2a} represents lower alkyl (which alkyl group is branched and unsaturated at the carbon atom that is attached to M), NR¹²R¹³, cyano, aryl or Het¹ (which Het¹ group is either aromatic or unsaturated at the carbon atom that is attached to M), R¹² and R¹³ are as hereinbefore defined and M represents an optionally substituted metal or boron group, which group is
- 10 suitable for cross-coupling reactions, for example a trialkylstannane (e.g. tri-*n*-butylstannane), a dialkylborane (e.g. diethylborane), a dialkoxy borane, a dihydroxyborane, lithium, a halomagnesium, a halozinc, copper, a halomercury, in the presence of an appropriate catalyst system (e.g. a palladium or nickel catalyst).

15

The cross-coupling reaction is preferably carried out in the presence of a base (e.g. potassium carbonate, cesium fluoride or triethylamine), preferably in excess. Those skilled in the art will appreciate that the type of catalyst that is employed will depend on factors such as the nature of

20 the M group, the substrate that is employed etc.

Typical procedures that may be employed include those described hereinafter. In a further typical procedure, a compound of formula R^2aM may be used, in which M is halozinc. Such a compound may be prepared by reaction of a compound R^2Hal , where Hal and R^2 are as hereinbefore
5 defined, with an alkyllithium (e.g. *n*-butyllithium) at a temperature of between $-78^\circ C$ and room temperature, in a suitable solvent (e.g. THF), and the resultant solution is then treated with $Zn(II)Cl_2$ (solution in ether) and the resultant solution is treated with a compound of formula XXIIIA or XXIIIB in the presence of a palladium catalyst (e.g.
10 tetrakis(triphenyl)phosphine palladium) in a suitable solvent (e.g. THF). The reaction may be carried out at from room temperature to reflux temperature.

Suitable coupling conditions also include so-called Suzuki and Stille
15 conditions such as those described hereinbefore in respect of preparation of compounds of formulae XIII A and XIII B.

The skilled person will appreciate that compounds of formulae IA and IB in which R^2 represents lower alkyl that is branched, but not unsaturated, at
20 the carbon atom that is attached to the rest of the molecule may be prepared by in this way, provided that the corresponding compound of formula IA or IB in which the corresponding R^2 group is unsaturated is subsequently hydrogenated under conditions known to those skilled in the art.

25

Compounds of formulae XXIIIA and XXIIIB may be prepared by cyclisation of corresponding compounds of formulae XXIVA and XXIVB, respectively:

XXIVA

XXIVB

in which R¹, R³, R⁴, A and Hal are as hereinbefore defined, for example under analogous reaction conditions to those described hereinbefore for compounds of formulae IIA and IIB.

Compounds of formulae XXIVA and XXIVB may be prepared analogously to methods described herein, for example coupling of a compound of formula IV, as hereinbefore defined, to an appropriate 4-amino-3-halopyrazole-5-carboxamide, which pyrazole compound may, in turn, be prepared by halogenation of a corresponding 4-aminopyrazole-5-carboxamide, under conditions which are well known to those skilled in the art.

Compounds of formulae XXIIIA and XXIIIB may alternatively be prepared from corresponding compounds of formulae XXVA and XXVB, respectively:

XXVA

XXVB

wherein A, Hal, R¹ and R³ are as hereinbefore defined, for example as described hereinbefore for preparation of compounds of formulae IA and IB from compounds of formulae XA and XB (see process 4 above).

5

Compounds of formulae XXVA and XXVB may be prepared *via* routine techniques (for example for compounds of formulae XXVA and XXVB in which A represents N, reduction of corresponding nitropyridine compounds of formulae XIID and XIIE as defined herein, respectively,

10

7. Compounds of formulae IA and IB in which R² represents N(H)C(O)R¹² may be prepared by acylation of a corresponding compound of formula IA or IB in which R² represents NH₂, using a compound of

15

in which L¹ and R¹² are as hereinbefore defined under conditions that are known to those skilled in the art.

20 8. Compounds of formulae IA and IB in which R² represents NR¹²R¹³ in which one of R¹² and R¹³ does not represent H may be prepared by alkylation of a corresponding compound of formula IA or IB in which R²

represents NH_2 using an appropriate alkylating agent under conditions that are known to those skilled in the art.

9. Compounds of formulae IA and IB in which R^2 represents $\text{NR}^{12}\text{R}^{13}$ in which one of R^{12} and R^{13} does not represent H may be prepared by reductive amination from a compound of formula IA or IB in which R^2 represents NH_2 , using an appropriate carbonyl compound under conditions that are known to those skilled in the art.
10. Compounds of formulae IA and IB in which R^2 represents NH_2 may be prepared by reduction of corresponding compounds of formulae XXVIIA or XXVIIB, respectively:

XXVIIA

XXVIIB

- wherein A, R^1 , R^3 and R^4 are as hereinbefore defined under conditions that are well known to those skilled in the art.

Compounds of formulae XXVIIA and XXVIIB may be prepared by nitration of corresponding compounds of formulae XXVIII A or XXVIII B, respectively:

XXVIII A

XXVIII B

wherein A, R¹, R³ and R⁴ are as hereinbefore defined, using conventional techniques. For example, nitration may be performed at or around room
 5 temperature using 1.5 to 3 eq. of ammonium nitrate in the presence of trifluoroacetic anhydride.

Compounds of formulae XXVIII A and XXVIII B may be prepared analogously to methods described herein in respect of the preparation of
 10 compounds of formulae IA and IB.

Compounds of formulae IIIA and IIIB, IV, VIIA and VIIB, IX, XIII, XIII F and XIII G, XVA and XVB, XVIIA and XVII B, XVIII, XXA and XXB, XXIA and XXIB and XXVI, and compounds of formulae
 15 HNR¹²R¹³, R^{2a}M, R¹L¹ and R¹OH, and derivatives thereof, when not commercially available or not subsequently described, may be obtained either by analogy with the processes described hereinbefore, or by conventional synthetic procedures, in accordance with standard techniques, from readily available starting materials using appropriate
 20 reagents and reaction conditions.

Substituents on aryl and Het/Het¹ groups in the above-mentioned compounds may be introduced, removed and interconverted, using techniques which are well known to those skilled in the art. For example, compounds of formulae IA and IB as described hereinbefore, in which R¹ represents an aryl or alkylaryl group, may be prepared by dehalogenating corresponding compounds of formula IA or IB, in which R¹ represents an aryl or alkylaryl substituted with a halo group, such as a bromo or iodo. The reaction may be performed using methods which are well known to those skilled in the art, for example using a suitable palladium catalyst, such as palladium (0) tetrakis(triphenyl)phosphine, a suitable hydrogen donor (e.g. sodium formate), and a suitable base (e.g. triethylamine), in a suitable solvent (e.g. acetonitrile and/or dimethylsulphoxide).

The skilled person will also appreciate that various standard substituent or functional group interconversions and transformations within certain compounds of formulae IA and IB will provide other compounds of formulae IA and IB. For example, alkoxide exchange at the 2-position of the 5-phenyl and the pyridin-3-yl substituents. Moreover, certain compounds of formulae IA and IB, for example those in which R¹⁴ and R¹⁵, together with the nitrogen to which they are attached, form a 4-R¹⁶-piperazinyl group, in which R¹⁶ does not represent H, may be prepared directly from the corresponding piperazine analogues in which R¹⁶ represents H, using standard procedures (e.g. alkylation).

The compounds of the invention may be isolated from their reaction mixtures using conventional techniques.

It will be appreciated by those skilled in the art that, in the course of carrying out the processes described above, the functional groups of intermediate compounds may need to be protected by protecting groups.

- 5 Functional groups which it is desirable to protect include hydroxy, amino and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl and diarylalkylsilyl groups (e.g. *tert*-butyldimethylsilyl, *tert*-butyldiphenylsilyl or trimethylsilyl) and tetrahydropyranyl. Suitable protecting groups for amino include *tert*-butyloxycarbonyl, 9-
10 fluorenylmethoxycarbonyl or benzyloxycarbonyl. Suitable protecting groups for carboxylic acid include C₁₋₆ alkyl or benzyl esters.

The protection and deprotection of functional groups may take place before or after any of the reaction steps described hereinbefore.

15

Protecting groups may be removed in accordance with techniques which are well known to those skilled in the art.

- The use of protecting groups is fully described in "Protective Groups in Organic Chemistry", edited by JWF McOmie, Plenum Press (1973), and
20 "Protective Groups in Organic Synthesis", 2nd edition, TW Greene & PGM Wutz, Wiley-Interscience (1991).

- Persons skilled in the art will also appreciate that, in order to obtain
25 compounds of formula I in an alternative, and, on some occasions, more convenient, manner, the individual process steps mentioned hereinbefore may be performed in a different order, and/or the individual reactions may be performed at a different stage in the overall route (i.e. substituents may

be added to and/or chemical transformations performed upon, different intermediates to those mentioned hereinbefore in conjunction with a particular reaction). This will depend *inter alia* on factors such as the nature of other functional groups present in a particular substrate, the availability of key intermediates and the protecting group strategy (if any) to be adopted. Clearly, the type of chemistry involved will influence the choice of reagent that is used in the said synthetic steps, the need, and type, of protecting groups that are employed, and the sequence for accomplishing the synthesis.

10

Pharmaceutically acceptable acid addition salts of the compounds of formulae IA and IB which contain a basic centre may be prepared in a conventional manner. For example, a solution of the free base may be treated with the appropriate acid, either neat or in a suitable solvent, and the resulting salt may then be isolated either by filtration or by evaporation under vacuum of the reaction solvent. Pharmaceutically acceptable base addition salts can be obtained in an analogous manner by treating a solution of a compound of formula IA or IB with the appropriate base. Both types of salt may be formed or interconverted using ion-exchange resin techniques.

20

It will be appreciated by those skilled in the art that certain protected derivatives of compounds of formula I, which may be made prior to a final deprotection stage, may not possess pharmacological activity as such, but may, in certain instances, be administered orally or parenterally and thereafter metabolised in the body to form compounds of the invention which are pharmacologically active. Such derivatives may therefore be

25

described as “prodrugs”. Further, certain compounds of formula I may act as prodrugs of other compounds of formula I.

All protected derivatives, and prodrugs, of compounds of formula I are
5 included within the scope of the invention.

Medical Use

The compounds of the invention are useful because they possess
10 pharmacological activity in animals, especially mammals, including humans. They are therefore indicated as pharmaceuticals, as well as for use as animal medicaments.

According to a further aspect of the invention there is provided the
15 compounds of the invention for use as pharmaceuticals, and for use as animal medicaments.

In particular, compounds of the invention have been found to be potent and selective inhibitors of cGMP PDEs, such as cGMP PDE5, for
20 example as demonstrated in the tests described below, and are thus useful in the treatment of medical conditions in humans, and in animals, in which cGMP PDEs, such as cGMP PDE5, are indicated, and in which inhibition of cGMP PDEs, such as cGMP PDE5, is desirable.

25 By the term “treatment”, we include both therapeutic (curative) or prophylactic treatment.

Thus, according to a further aspect of the invention there is provided the use of the compounds of the invention in the manufacture of a medicament for the treatment of a medical condition in which a cGMP PDE (e.g. cGMP PDE5) is indicated. There is further provided the use of the
5 compounds of the invention in the manufacture of a medicament for the treatment of a medical condition in which inhibition of a cGMP PDE (e.g. cGMP PDE5) is desirable.

The compounds of the invention are thus expected to be useful for the
10 curative or prophylactic treatment of male erectile dysfunction (MED), female sexual dysfunction (FSD), premature labour, dysmenorrhoea, benign prostatic hyperplasia (BPH), bladder outlet obstruction, incontinence, stable and unstable variant (Prinzmetal) angina, hypertension, pulmonary hypertension, congestive heart failure,
15 atherosclerosis, stroke, peripheral vascular disease, conditions of reduced blood vessel patency (e.g. post transluminal coronary angioplasty (post-PTCA)), chronic asthma, bronchitis, allergic asthma, allergic rhinitis, glaucoma and diseases characterised by disorders of gut motility (e.g. irritable bowel syndrome (IBS)). Other conditions which may be
20 mentioned include pre-eclampsia, Kawasaki's syndrome, nitrate tolerance, multiple sclerosis, peripheral diabetic neuropathy, stroke, Alzheimer's disease, acute respiratory failure, psoriasis, skin necrosis, cancer metastasis, baldness, nutcracker oesophagus, anal fissure and hypoxic vasoconstriction. Particularly preferred conditions include MED and
25 FSD.

Thus the invention provides a method of treating or preventing a medical condition for which a cGMP PDE5 inhibitor is indicated, in an animal

(e.g. a mammal, including a human being), which comprises administering a therapeutically effective amount of a compound of the invention to a mammal in need of such treatment.

5 **Pharmaceutical Preparations**

The compounds of the invention will normally be administered orally or by any parenteral route, in the form of pharmaceutical preparations comprising the active ingredient, optionally in the form of a non-toxic
10 organic, or inorganic, acid, or base, addition salt, in a pharmaceutically acceptable dosage form. Depending upon the disorder and patient to be treated, as well as the route of administration, the compositions may be administered at varying doses.

15 The compounds of the invention may also be combined with any other drugs useful in the inhibition of cGMP-PDEs, such as cGMP-PDE5.

In human therapy, the compounds of the invention can be administered alone but will generally be administered in admixture with a suitable
20 pharmaceutical excipient diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice.

For example, the compounds of the invention can be administered orally, buccally or sublingually in the form of tablets, capsules, ovules, elixirs,
25 solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed- or controlled-release applications. The compounds of invention may also be administered *via* intracavernosal injection.

Such tablets may contain excipients such as microcrystalline cellulose, lactose, sodium citrate, calcium carbonate, dibasic calcium phosphate and glycine, disintegrants such as starch (preferably corn, potato or tapioca starch), sodium starch glycollate, croscarmellose sodium and certain complex silicates, and granulation binders such as polyvinylpyrrolidone, hydroxypropylmethylcellulose (HPMC), hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.

Solid compositions of a similar type may also be employed as fillers in gelatin capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols. For aqueous suspensions and/or elixirs, the compounds of the invention may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, propylene glycol and glycerin, and combinations thereof.

20

The compounds of the invention can also be administered parenterally, for example, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intrasternally, intracranially, intramuscularly or subcutaneously, or they may be administered by infusion techniques.

They are best used in the form of a sterile aqueous solution which may contain other substances, for example, enough salts or glucose to make the solution isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if necessary. The

preparation of suitable parenteral formulations under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known to those skilled in the art.

- 5 For oral and parenteral administration to human patients, the daily dosage level of the compounds of the invention will usually be from 10 to 500 mg/kg (in single or divided doses).

Thus, for example, the tablets or capsules of the compound of the
10 invention may contain from 5 mg to 250 mg of active compound for administration singly or two or more at a time, as appropriate. The physician in any event will determine the actual dosage which will be most suitable for any individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of
15 the average case. There can, of course, be individual instances where higher or lower dosage ranges are merited and such are within the scope of this invention.

The compounds of the invention can also be administered intranasally or
20 by inhalation and are conveniently delivered in the form of a dry powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray or nebuliser with the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA
25 134ATM or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EATM), carbon dioxide or other suitable gas. In the case of a pressurised aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray or nebuliser may contain

a solution or suspension of the active compound, e.g. using a mixture of ethanol and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated to contain a powder mix of a compound of the invention and a
5 suitable powder base such as lactose or starch.

Aerosol or dry powder formulations are preferably arranged so that each metered dose or "puff" contains from 1 to 50 mg of a compound of the invention for delivery to the patient. The overall daily dose with an
10 aerosol will be in the range of from 1 to 50 mg, which may be administered in a single dose or, more usually, in divided doses throughout the day.

Alternatively, the compounds of the invention can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a lotion, solution, cream, ointment or dusting powder. The compounds of the invention may also be transdermally administered, for example, by the use of a skin patch. They may also be administered by
15 the ocular route, particularly for treating diseases of the eye.
20

For ophthalmic use, the compounds of the invention can be formulated as micronised suspensions in isotonic, pH adjusted, sterile saline, or, preferably, as solutions in isotonic, pH adjusted, sterile saline, optionally
25 in combination with a preservative such as a benzylalkonium chloride. Alternatively, they may be formulated in an ointment such as petrolatum.

For application topically to the skin, the compounds of the invention can be formulated as a suitable ointment containing the active compound suspended or dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl esters wax, cetaryl alcohol, 2-octyldodecanol, benzyl alcohol and water.

The skilled person will also appreciate that, in the treatment of certain conditions (including MED and FSD), compounds of the invention may be taken as a single dose on an "as required" basis (i.e. as needed or desired).

Generally, in humans, oral administration of the compounds of the invention is the preferred route, being the most convenient and, for example in MED, in avoiding the well-known disadvantages associated with intracavernosal (i.c.) administration.

A preferred oral dosing regimen in MED for a typical man is from 25 to 250 mg of compound when required.

In circumstances where the recipient suffers from a swallowing disorder or from impairment of drug absorption after oral administration, the drug may be administered parenterally, e.g. sublingually or buccally.

For veterinary use, a compound of the invention is administered as a suitably acceptable formulation in accordance with normal veterinary practice and the veterinary surgeon will determine the dosing regimen and route of administration which will be most appropriate for a particular
5 animal.

Thus, according to a further aspect of the invention there is provided a pharmaceutical formulation including a compound of the invention in admixture with a pharmaceutically or veterinarily acceptable adjuvant,
10 diluent or carrier.

In addition to the fact that compounds of the invention inhibit cyclic guanosine 3',5'-monophosphate phosphodiesterases (cGMP PDEs) and in particular, are potent and selective inhibitors of cGMP PDE5, compounds
15 of the invention may also have the advantage that they may be more efficacious than, be less toxic than, have a broader range of activity than, be more potent than, produce fewer side effects than, be more easily absorbed than, or they may have other useful pharmacological properties over, compounds known in the prior art.

20

The biological activities of the compounds of the present invention were determined by the following test methods.

Biological Tests

25

Phosphodiesterase (PDE) Inhibitory Activity

In vitro PDE inhibitory activities against cyclic guanosine 3',5'-monophosphate (cGMP) and cyclic adenosine 3',5'-monophosphate

(cAMP) phosphodiesterases were determined by measurement of their IC_{50} values (the concentration of compound required for 50% inhibition of enzyme activity).

5 The required PDE enzymes were isolated from a variety of sources, including human corpus cavernosum, human and rabbit platelets, human cardiac ventricle, human skeletal muscle and bovine retina, essentially by the method of W.J. Thompson and M.M. Appleman (Biochem., 1971, 10, 311). In particular, the cGMP-specific PDE (PDE5) and the cGMP-
10 inhibited cAMP PDE (PDE3) were obtained from human corpus cavernosum tissue, human platelets or rabbit platelets; the cGMP-stimulated PDE (PDE2) was obtained from human corpus cavernosum; the calcium/calmodulin (Ca/CAM)-dependent PDE (PDE1) from human cardiac ventricle; the cAMP-specific PDE (PDE4) from human skeletal
15 muscle; and the photoreceptor PDE (PDE6) from bovine retina.

Assays were performed using a modification of the "batch" method of W.J. Thompson et al. (Biochem., 1979, 18, 5228). Results from these tests show that the compounds of the present invention are potent and
20 selective inhibitors of cGMP-specific PDE5.

Functional Activity

This was assessed *in vitro* by determining the capacity of a compound of the invention to enhance sodium nitroprusside-induced relaxation of
25 precontracted rabbit corpus cavernosum tissue strips, as described by S.A. Ballard et al. (Brit. J. Pharmacol., 1996, 118 (suppl.), abstract 153P).

In Vivo Activity

Compounds may be screened in anaesthetised dogs to determine their capacity, after i.v. administration, to enhance the pressure rises in the corpora cavernosa of the penis induced by intracavernosal injection of sodium nitroprusside, using a method based on that described by Trigo-Rocha *et al.* (Neurourol. and Urodyn., 1994, 13, 71).

Safety Profile

Compounds of the invention may be tested at varying i.v and p.o. doses in animals such as mouse and dog, observing for any untoward effects.

Examples and Preparations

The synthesis of the compounds of the invention and of the intermediates for use therein are illustrated by the following Examples and Preparations.

¹H nuclear magnetic resonance (NMR) spectra were recorded using either a Varian Unity 300 or a Varian Inova 400 spectrometer and were in all cases consistent with the proposed structures. Characteristic chemical shifts (δ) are given in parts-per-million downfield from tetramethylsilane using conventional abbreviations for designation of major peaks: eg s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad.

Mass spectra (m/z) were recorded using a Fisons Instruments Trio mass spectrometer in the thermospray ionisation mode.

Room temperature includes 20 to 25°C.

Synthesis of Intermediates

Preparation 1

4-Nitro-1H-pyrazole-3,5-dicarboxylic acid

- 5 Fuming sulphuric acid (105ml) was added dropwise over 45 minutes to ice-cooled fuming nitric acid (88ml), so as to maintain the internal temperature below 20°C. Once addition was complete the mixture was warmed to 40°C, pyrazole-3,5-dicarboxylic acid (125g, 0.80mol) added portionwise over 75 minutes, so as to maintain the reaction temperature
- 10 below 50°C, and the reaction then stirred at 60°C for 18 hours. The cooled mixture was poured onto ice (1kg), and flaked potassium hydroxide carefully added with stirring, until the solution pH was 2. The resulting precipitate was filtered, and triturated with boiling water (500ml), to afford the title compound (123g, 76%) as a white solid.
- 15 m.p. 325-327°C.

Preparation 2

4-Nitro-1H-pyrazole-3,5-dicarboxylic acid dimethyl ester

- Thionyl chloride (290ml, 3.98mol) was added dropwise over 2 hours, to
- 20 an ice cooled suspension of the title compound of Preparation 1 (123g, 0.61mol) in dry methanol (1200ml), and the reaction stirred under reflux for 48 hours. The cooled mixture was concentrated under reduced pressure, partitioned between water (500ml) and dichloromethane (500ml), and filtered. The phases were separated, the aqueous layer
- 25 extracted with dichloromethane (4x250ml), the combined organic solutions dried (Na₂SO₄), and evaporated under reduced pressure to afford the title compound (74.6g, 53%) as a white solid.

Preparation 3

4-Nitro-1-(pyridin-2-yl)methyl-1H-pyrazole-3,5-dicarboxylic acid dimethyl ester

Cesium carbonate (14.22g, 43.6mmol) was added to a solution of the title compound of Preparation 2 (10.0g, 43.6mmol) in dimethylformamide (100ml), and the mixture stirred at room temperature for 30 minutes. 2-(Chloromethyl)pyridine hydrochloride (7.16g, 43.6mmol) was added and the reaction stirred at room temperature for a further 22 hours. The reaction mixture was concentrated under reduced pressure, the residue partitioned between dichloromethane (150ml) and water (70ml), and the layers separated. The aqueous phase was extracted with dichloromethane (2x100ml), the combined organic extracts dried ($MgSO_4$), and evaporated under reduced pressure. The residual brown solid was purified by column chromatography on silica gel, using an elution gradient of ethyl acetate:pentane (20:80 to 50:50) to afford the title compound, (6.34g, 45%) as a white solid.

Preparation 44-Nitro-1-(pyridin-3-yl)methyl-1H-pyrazole-3,5-dicarboxylic acid dimethyl ester

A mixture of the title compound of Preparation 2 (4.0g, 17mmol), and cesium carbonate (2.86g, 19mmol) in dimethylformamide (100ml) was stirred at room temperature for 45 minutes, 3-(chloromethyl)pyridine hydrochloride (6.26g, 19mmol) added and stirring continued for a further 18 hours. The reaction mixture was concentrated under reduced pressure, and the residue partitioned between ethyl acetate (50ml) and water (50ml). The phases were separated, the aqueous layer extracted with ethyl acetate (2x50ml) and the combined organic extracts dried (Na_2SO_4) and evaporated under reduced pressure. The residual brown oil was purified by column chromatography on silica gel, using an elution gradient of dichloromethane:methanol (100:0 to 98:2) to afford the title compound (2.40g, 45%) as a white solid.

Preparation 18Dimethyl 4-(2-n-propoxybenzamido)-1-(pyridin-2-yl)methyl-1H-pyrazole-3,5-dicarboxylate

A solution of the title compound of Preparation 11 (1.56g, 7.84mmol) in
5 dichloromethane (5ml) was added slowly to a solution of 2-n-
propoxybenzoyl chloride (1.56g, 7.84mmol) in pyridine (10ml) and the
reaction stirred at room temperature for 18 hours. The reaction mixture
was concentrated under reduced pressure, azeotroped with toluene and the
residual brown oil partitioned between dichloromethane (10ml) and
10 saturated sodium bicarbonate solution (15ml). The phases were separated,
the aqueous layer extracted with dichloromethane (3x10ml), and the
combined organic extracts washed with aqueous copper (II) sulphate
solution (2x10ml), dried (Na₂SO₄) and evaporated under reduced pressure.
The residue was purified by column chromatography on silica gel, using
15 an elution gradient of dichloromethane:methanol (100:0 to 98:2) to afford
the title compound (1.80g, 51%) as a yellow foam.

Preparation 323-Carboxamido-5-(2-n-propoxyphenyl)-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

A mixture of the title compound of Preparation 25 (1.2g, 3.62mmol) and potassium t-butoxide (1.63g, 14.49mmol) in n-propanol (50ml) was heated under reflux for 18 hours. The cooled reaction mixture was concentrated under reduced pressure, the residue dissolved in water (30ml), washed with ethyl acetate (20ml) and acidified to pH 4 with hydrochloric acid.

The resulting precipitate was filtered, washed with water and dried at 60°C. A mixture of this solid, and N,N'-carbonyldiimidazole (670mg, 4.13mmol) in tetrahydrofuran (50ml) was heated under reflux for 3 hours, then cooled in an ice-bath. The mixture was saturated with ammonia gas, and stirred at room temperature for 18 hours. The resulting precipitate was filtered, washed with ethyl acetate and dried at 60°C to afford the title compound (510mg, 45%) as a beige solid.

3-N-Methylcarboxamido-5-(2-n-propoxyphenyl)-1-(pyridin-2-yl)methyl-1,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

A mixture of the title compound of Preparation 26 (600mg, 1.48mmol) and 2N aqueous sodium hydroxide solution (20ml) in dioxan (10ml) was heated under reflux for 18 hours. The cooled reaction mixture was neutralized with 2N hydrochloric acid, concentrated under reduced pressure and azeotroped with toluene. The residual white solid was suspended in dichloromethane (20ml), N-methylmorpholine (360ml, 3.26mmol), 1-hydroxybenzotriazole hydrate (220mg, 1.63mmol), methylamine hydrochloride (220mg, 3.26mmol) and finally 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (312mg, 1.63mmol) added and the reaction stirred at room temperature for 18 hours. The reaction mixture was filtered, sodium bicarbonate solution (20ml) added, and the phases separated. The aqueous phase was extracted with dichloromethane (4x20ml), the combined organic extracts washed with brine (20ml), dried and evaporated under reduced pressure. The

crude product was purified by column chromatography on silica gel, using an elution gradient of dichloromethane:methanol:0.88 ammonia (100:0:0 to 98:2:1) to afford the title compound (170mg, 30%) as a pale yellow solid.

A mixture of the title compound of Preparation 29 (2.56g, 5.3mmol) and
5 6N aqueous sodium hydroxide solution (60ml) in ethanol (30ml) was
heated under reflux for 18 hours. The cooled reaction mixture was
acidified with hydrochloric acid, the resulting precipitate filtered, washed
with water, and dried at 60°C, to give a white solid. A mixture of this
product, N-methylmorpholine (1.29ml, 11.7mmol), 1-
10 hydroxybenzotriazole hydrate (950mg, 6.2mmol), methylamine
hydrochloride (357mg, 5.3mmol) and finally 1-(3-dimethylaminopropyl)-
3-ethylcarbodiimide hydrochloride (1.28mg, 6.7mmol) in dichloromethane
(40ml) was stirred at room temperature for 3 hours. The reaction mixture
was washed with ammonium chloride solution (10ml), then sodium
15 bicarbonate solution (10ml), dried (Na₂SO₄) and concentrated under
reduced pressure. The residue was purified by column chromatography on
silica gel, using dichloromethane:methanol:0.88 ammonia (98:2:0.2) as

Preparation 822-Ethoxypyridine-3-carboxylic acid ethyl ester

A suspension of the title compound of Preparation 81 (16.4g, 98mmol),
5 and cesium carbonate (32g, 98mmol) in dimethylformamide (240ml) was
stirred at room temperature for 2 hours. Ethyl iodide (7.85ml, 98mmol)
was added and the reaction stirred for a further 24 hours. The reaction
mixture was concentrated under reduced pressure and the residue
partitioned between aqueous sodium carbonate solution (100ml) and ethyl
10 acetate (100ml). The phases were separated and the aqueous phase
extracted with ethyl acetate (2x100ml). The combined organic phases were
washed with brine, dried (Na_2SO_4) and evaporated under reduced pressure
to afford the title compound (18.0g, 94%) as a pale yellow oil.

Preparation 832-Ethoxy-5-nitropyridine-3-carboxylic acid ethyl ester

Ammonium nitrate (5.36g, 66mmol) was added portionwise to an ice-
20 cooled solution of the title compound of Preparation 82 (4.66g, 22.3mmol)
in trifluoroacetic anhydride (50ml) and the reaction stirred for 18 hours at
room temperature. The reaction mixture was carefully poured into ice
water (200ml) and the resulting suspension stirred for an hour. The
precipitate was filtered off, washed with water and dried under suction to
25 afford the title compound (3.29g, 61%).

Preparation 842-Ethoxy-5-nitropyridine-3-carboxylic acid

Aqueous sodium hydroxide solution (4ml, 5N, 20mmol) was added dropwise to a solution of the title compound of Preparation 83 (5.1g, 20mmol) in ethanol (100ml) and the reaction stirred at room temperature for 18 hours. The reaction mixture was concentrated under reduced pressure, the residue suspended in water (50ml) and acidified to pH 3 with hydrochloric acid. This aqueous solution was extracted with ethyl acetate (3x100ml), the combined organic layers washed with brine (100ml), dried (Na₂SO₄) and evaporated under reduced pressure to give a beige solid. The crude product was recrystallised from ethyl acetate/hexane to afford the title compound (3.32g, 78%) as beige crystals.

Preparation 1062-Ethoxy-5-nitropyridine-3-carbonitrile

Trifluoroacetic anhydride (3.46g, 16.5mmol) in dioxan (5ml) was added to an ice-cold solution of the title compound of preparation 104 (2.32g, 11.0mmol) and pyridine (2.17g, 27.5mmol) in dioxan (15ml), and the solution stirred at room temperature for 3 hours. The mixture was concentrated under reduced pressure and the residue partitioned between ethyl acetate and water. The layers were separated and the organic phase washed consecutively with hydrochloric acid (2N, 2x), aqueous saturated sodium bicarbonate solution, then brine. The solution was dried (MgSO₄) and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel using an elution gradient of pentane:ethyl acetate (100:0 to 95:5) to afford the title compound (1.73g, 81%).

δ (CDCl₃) : 1.50 (3H, t), 4.63 (2H, q), 8.66 (1H, d), 9.20 (1H, d).

Preparation 1072-(2-Methoxyethoxy)-5-nitropyridine-3-carbonitrile

The title compound was prepared from the title compound of preparation 105, following a similar procedure to that described in preparation 106. The crude product was purified by trituration, and filtration from diethyl ether to give the desired product, (18.27g, 97%) as a solid.

δ (CDCl₃) : 3.42 (3H, s), 3.81 (2H, t), 4.76 (2H, t), 8.68 (1H, d), 9.20 (1H, d).

Preparation 1082-Ethoxy-5-nitropyridine-3-carboximidamide acetate

The title compound of preparation 106 (11.0g, 57.0mmol) was added "in one portion" to a cooled (-10°C) solution of ethanol saturated with HCl gas (100ml), and the reaction stirred at this temperature for 8 hours. The reaction was evaporated under reduced pressure, the residue triturated with diethyl ether, and the precipitate filtered off. The solid was partitioned between ethyl acetate and aqueous saturated sodium bicarbonate solution, and the layers separated. The organic phase was washed with aqueous saturated sodium bicarbonate solution, brine, then dried (MgSO₄), and evaporated under reduced pressure to give a white solid, 4.25g. Ammonium acetate (3.61g, 46.9mmol) was added to a solution of this intermediate imidate (8.62g) in ethanol (80ml), and the reaction heated under reflux for an hour. Tlc analysis showed starting material remaining, so additional ammonium acetate (0.5g, 6.5mmol) was added, and the reaction heated under reflux for a further 30 minutes. The cooled reaction mixture was evaporated under reduced pressure and the residue triturated with diethyl ether. The resulting solid was filtered off, and dried under vacuum to afford the title compound (8.26g).

Preparation 110

Ethyl 2-ethoxy-1-methyl-pyrazole-4-carboxylate

Diethyl azodicarboxylate (1.3ml, 7.5mmol) was added dropwise to a
10 solution of ethyl 2-hydroxy-1-methyl-pyrazole-4-carboxylate (Chem.
Pharm. Bull; 1983; 31; 1228), (880mg, 5.0mmol), and triphenylphosphine
(2.03g, 7.5mmol) in ethanol (0.3ml, 5.0mmol) and tetrahydrofuran
(100ml), and the reaction stirred at room temperature for 4 hours. The
mixture was concentrated under reduced pressure, the residue partitioned
15 between dichloromethane and water, and the layers separated. The
aqueous phase was extracted with dichloromethane, the combined organic
solutions washed consecutively with water, 2N aqueous sodium
hydroxide, water and finally brine. The solution was then dried (Na₂SO₄),
and evaporated under reduced pressure. The crude product was purified
20 by column chromatography on silica gel using dichloromethane as eluant
to afford the title compound (768mg, 79%), as a crystalline solid.

Preparation 111Ethyl 2-ethoxy-1-methyl-3-nitro-pyrazole-4-carboxylate

Fuming nitric acid (0.43ml) was added dropwise to ice-cooled concentrated sulphuric acid (2.6ml), and the resulting solution warmed to 40°C. The title compound of preparation 110 (433mg, 2.18mmol) was added portion-wise, and the reaction mixture stirred for a further 50 minutes. The reaction was poured carefully onto ice, and the resulting mixture extracted with dichloromethane. The combined organic extracts were washed with water, and brine, then dried (Na₂SO₄), and evaporated under reduced pressure to afford the title compound, (301mg, 57%) as an orange oil.

Preparation 1135-(2-Ethoxy-5-nitropyridin-3-yl)-2-methyl-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

5 A mixture of the title compounds of preparations 98 (3.85g, 27.5mmol) and 108 (8.26g, 30.6mmol) in 3-methyl-3-pentanol (80ml) were heated under reflux for 2½ hours, then cooled. The reaction mixture was partitioned between dichloromethane and hydrochloric acid (2N), and the resulting precipitate filtered, washed with water and diethyl ether, and
10 dried. The filtrate was separated, and the organic layer washed with hydrochloric acid (2N), saturated aqueous sodium bicarbonate solution, brine, then dried (MgSO₄) and evaporated under reduced pressure. The residue was triturated with diethyl ether, and the resulting solid filtered and dried. The isolated solids were combined to provide the title
15 compound (6.9g, 79%).

Sodium nitrite (380mg, 5.5mmol) was added to a cooled (-10°C) solution of the title compound of preparation 118 (1.05g, 3.7mmol) in acetic acid (16ml) and concentrated hydrochloric acid (16ml), and the solution stirred at 0°C for 2 hours. The solution was re-cooled to -30°C, liquid sulphur dioxide (11ml) added, followed by a solution of copper (II) chloride (1.5g, 11.1mmol) in water (5ml). The reaction mixture was stirred at 0°C for 30 minutes and at room temperature for an additional 2 hours. The reaction was poured onto ice, and this aqueous mixture extracted with dichloromethane. The combined organic extracts were dried (MgSO₄), and evaporated under reduced pressure. A solution of this intermediate sulphonyl chloride in dichloromethane (5ml) was cooled in ice. N-Ethylpiperazine (0.7ml, 5.55mmol) was added and the reaction stirred at room temperature for 20 hours, then evaporated under reduced pressure. The residue was suspended in aqueous saturated sodium bicarbonate solution, and extracted with ethyl acetate. The combined organic extracts were evaporated under reduced pressure to afford the title compound, (530mg, 32%).

Ammonium nitrate (115mg, 1.45mmol) was added to a solution of the
5 compound of preparation 121 (430mg, 0.96mmol) in trifluoroacetic
anhydride (20ml), and the reaction stirred at room temperature for 18
hours. Tlc analysis showed starting material remaining, so additional
ammonium nitrate (115mg, 1.45mmol) was added, and the reaction stirred
for a further 3 hours. The reaction mixture was carefully diluted with
10 water, then basified to pH 8 using sodium carbonate, and extracted with
ethyl acetate. The combined organic extracts were dried (MgSO_4), and
evaporated under reduced pressure. The residue was re-partitioned

Preparation 156

4-[2-Ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)pyridin-3-ylcarboxamido]-3-methoxycarbonyl-2-methyl-pyrazole-5-carboxamide

10 The title compound of preparation 52 (9.0g, 45.0mmol) was added to a suspension of the title compound of preparation 69 (19.9g, 50.0mmol) in dichloromethane (200ml), and the mixture cooled in an ice-bath. Triethylamine (21ml, 150.0mmol) was added dropwise over 30 minutes, and once addition was complete, the reaction was stirred at room

15 temperature for 20 hours. The reaction mixture was washed with aqueous saturated sodium bicarbonate solution, and water, then dried (Na_2SO_4) and evaporated under reduced pressure. The residual solid was triturated with ethanol, filtered and dried to afford the title compound (16.0g, 68%).

5-[2-Ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)pyridin-3-yl]-2-methyl-7-oxo-2,6-dihydro-[4,3-d]pyrimidine-3-carboxylic acid

A mixture of the title compound from preparation 156 (16.0g, 30.4mmol) and potassium bis(trimethylsilyl)amide (25.0g, 125.2mmol) in ethanol

(900ml) was heated at 110°C in a sealed vessel for 18 hours. The cooled mixture was diluted with sufficient water to obtain a solution, then acidified to pH 3 using hydrochloric acid. The resulting precipitate was filtered slowly, and dried. The solid was suspended in water (200ml), and
5 basified to pH 12 using 0.88 ammonia solution. The mixture was heated to reflux, then cooled in ice and the resulting precipitate filtered and dried to afford the title compound (10.1g, 68%).

15 oxo-2,6-dihydro-[4,3-d]pyrimidine-3-carboxylic acid chloride
hydrochloride

Oxalyl chloride (230μl, 2.6mmol) was added to a suspension of the title compound of preparation 157 (500mg, 1.02mmol) and N,N-dimethylformamide (20μl) in dichloromethane (40ml) and the reaction
20 stirred at room temperature for 2½ hours. The reaction mixture was evaporated under reduced pressure, azeotroped with toluene and dried under vacuum to afford the title compound, (450mg), as a pale yellow solid.

A mixture of the title compound of preparation 123 (55mg, 0.11mmol) and 10% palladium on charcoal (6mg) in ethanol (5ml), was hydrogenated at 50 psi (345 kPa) and room temperature for 4 hours. The mixture was filtered through Arbocel®, and the filtrate evaporated under reduced pressure. The crude product was purified by column chromatography on silica gel using an elution gradient of dichloromethane:methanol (100:0 to 90:10) to afford the title compound, (28mg, 55%).

Thionyl chloride (64 μ l, 0.87mmol) and chlorosulphonic acid (387 μ l, 5.82mmol) were added to an ice cooled flask containing the title compound of Preparation 26 (235mg, 0.58mmol), and the reaction stirred at room temperature for 18 hours. Ice (1g) was carefully added with stirring, then N-methylpiperazine (2ml, 18.0mmol) followed by sufficient ethanol to obtain a solution. The mixture was stirred for 3 hours at room temperature and evaporated under reduced pressure. The residue was

partitioned between dichloromethane (5ml) and saturated sodium bicarbonate solution (10ml), and the phases separated. The aqueous layer was extracted with dichloromethane (3x10ml), the combined organic solutions dried (Na_2SO_4) and evaporated under reduced pressure. The residual yellow oil was purified by column chromatography on silica gel, using an elution gradient of dichloromethane:methanol (100:0 to 97:3) to afford the title compound (160mg, 50%) as a pale yellow solid.

Thionyl chloride (26 μ l, 0.36mmol) and chlorosulphonic acid (160 μ l, 2.39mmol) were added to an ice cooled flask containing the title compound of Preparation 33 (100mg, 0.24mmol) and the reaction stirred at room temperature for 18 hours. Ice (1g) was carefully added, then N-methylpiperazine (3ml, 27.0mmol) followed by enough ethanol to ensure solution, and the mixture stirred at room temperature for 4 hours. The reaction mixture was concentrated under reduced pressure, the residue partitioned between dichloromethane (5ml) and saturated sodium bicarbonate solution (10ml), and the phases separated. The aqueous layer was extracted with dichloromethane (3x10ml), the combined organic solutions washed with water (10ml), dried (Na_2SO_4) and evaporated under

reduced pressure. The residue was triturated with diethyl ether, to afford the title compound (95mg, 68%) as a white solid.

5-[5-(4-Methylpiperazin-1-ylsulphonyl)-2-n-propoxyphenyl]-7-oxo-2,6-dihydro-2H-pyrazolo[4,3-d]pyrimidine-3-carboxamide hydrochloride

Thionyl chloride (1ml, 13.7mmol) was added to an ice-cooled solution of the title compound of Preparation 32 (490mg, 1.56mmol) in chlorosulphonic acid (2ml, 30.0mmol), and the reaction stirred at room temperature for 18 hours. The reaction mixture was poured carefully onto ice (10g), and the resulting precipitate filtered, washed with water and dried under suction to give a beige solid (360mg). N-Methylpiperazine (180ml, 1.65mmol) was added to a suspension of this solid in ethanol (20ml) and the reaction stirred at room temperature for 18 hours. The reaction mixture was concentrated under reduced pressure, the residue suspended in water (10ml), and acidified to pH 6 with 2N hydrochloric acid. The resulting precipitate was filtered, washed with water and diethyl ether and dried at 60°C to afford the title compound (305mg, 44%) as an off-white powder.

ice (5g), and the aqueous solution extracted with dichloromethane
(3x15ml). The combined organic extracts were dried (MgSO₄) and
10 evaporated under reduced pressure, and the residue triturated with water
and diethyl ether, to give a white solid (90mg). N-Methyl piperazine
(40 μ l, 0.36mmol) was added to a suspension of this product in ethanol
(5ml) and the reaction stirred at room temperature for 18 hours. The
reaction mixture was concentrated under reduced pressure, the residue
15 dissolved in dichloromethane (25ml), washed with water (2x10ml), dried

5 A mixture of the title compound of Preparation 88 (120mg, 0.35mmol), chlorosulphonic acid (230 μ l, 3.5mmol) and thionyl chloride (38 μ l, 0.52mmol) was stirred at room temperature for 18 hours. The mixture was cooled in an ice-bath, ice (1g) added, followed by N-ethylpiperazine (2ml) and ethanol (1ml) and the reaction stirred at room temperature for 5
10 hours. The mixture was partitioned between dichloromethane (10ml) and sodium bicarbonate solution (5ml), and the phases separated. The aqueous layer was extracted with dichloromethane (3x10ml), the combined organic solutions washed with brine (20ml), dried (Na₂SO₄) and evaporated under reduced pressure. The residue was purified by column chromatography on
15 silica gel, using an elution gradient of dichloromethane:methanol (100:0 to 98:2) to afford the title compound, (120mg, 66%) as a pale pink solid.

Sodium nitrite (38mg, 0.55mmol) was added to a cooled (-10°C) solution of the title compound of preparation 138 (120mg, 0.27mmol) in acetic acid (4ml) and concentrated hydrochloric acid (4ml), and the solution stirred at 0°C for 90 minutes. The solution was re-cooled to -30°C, liquid sulphur dioxide (4ml) added, followed by a solution of copper (II) chloride (108mg, 0.80mmol) in water (5 drops). The reaction mixture was stirred at 0°C for 30 minutes and at room temperature for an additional 90 minutes. The mixture was then diluted with dichloromethane, and the phases separated. The aqueous phase was extracted with dichloromethane, the combined organic solutions dried (MgSO₄), and evaporated under reduced pressure. The residue was azeotroped with toluene to give a yellow solid. A solution of this intermediate sulphonyl chloride in dichloromethane was cooled in ice. Triethylamine (120µl, 0.86mmol) and N-ethylpiperazine (70µl, 0.54mmol) were added and the reaction stirred at room temperature for 20 hours. The reaction was washed with saturated aqueous sodium bicarbonate solution, and brine, then dried (MgSO₄) and concentrated under reduced pressure. The crude product was purified by column chromatography on silica gel using dichloromethane:methanol (95:5) as eluant to afford the title compound, (84mg, 51%) as a white solid.

- 5 *n*-Butyllithium (3.0ml, 1.6M in hexanes, 4.8mmol) was added dropwise to a cooled (-70°C) solution of the title compound of preparation 144 (900mg, 4.22mmol) in tetrahydrofuran (10ml), and the solution stirred for 30 minutes. A solution of triisopropyl borate (1.46ml, 6.33mmol) in tetrahydrofuran (4ml) was added dropwise, and the reaction then allowed
- 10 to warm to room temperature over 3 hours. The reaction was quenched by the addition of hydrochloric acid (2N), and the mixture then evaporated under reduced pressure. A mixture of the title compound of preparation 122 (65mg, 0.117mmol), potassium carbonate (65mg, 0.47mmol), the intermediate boronic acid (50mg), and
- 15 tetrakis(triphenylphosphine)palladium (0) (15mg, 0.013mmol) in dioxan (5ml) and water (1.5ml) was heated under reflux for 2 hours. Tlc analysis showed starting material remaining, so additional crude boronic acid (50mg) and tetrakis(triphenylphosphine)palladium (0) (15mg, 0.013mmol) were added and the reaction continued for a further 3 hours. The cooled
- 20 mixture was concentrated under reduced pressure, and the residue partitioned between water and dichloromethane and the phases separated. The aqueous layer was extracted with dichloromethane and the combined organic solutions washed with brine, dried (MgSO₄) and evaporated under reduced pressure. The crude product was purified by medium pressure

Example 78

5-[2-Ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)pyridin-3-yl]-2-methyl-3-(5-methyl-1,3,4-oxadiazol-2-yl)-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

Acetic hydrazide (80mg, 1.08mmol), followed by triethylamine (0.34ml, 2.44mmol) were added to a suspension of the title compound of preparation 158 (500mg, 0.98mmol) in dichloromethane (15ml), and the reaction stirred at room temperature for 4 hours. The reaction mixture was partitioned between dichloromethane and aqueous sodium bicarbonate solution, and the layers separated. The aqueous phase was extracted with dichloromethane, and the combined organic solutions dried (Na_2SO_4) and evaporated under reduced pressure, to give a solid, 520mg. Thionyl chloride (5ml) was added to this intermediate hydrazide (350mg), and the solution stirred at 80°C for 3 hours. The cooled reaction was partitioned between dichloromethane and aqueous sodium bicarbonate solution, and the layers separated. The organic phase was dried (Na_2SO_4) and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel using an elution gradient of dichloromethane:methanol (99:1 to 94:6) to give the title compound, 55mg.

δ (CDCl_3) : 1.01 (3H, t), 1.60 (3H, t), 2.41 (2H, q), 2.58 (4H, m), 2.75 (3H, s), 3.17 (4H, m), 4.58 (3H, s), 4.80 (2H, q), 8.69 (1H, s), 9.19 (1H, s), 10.88 (1H, s).

Example 79

5-[2-Ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)-pyridin-3-yl]-2-methyl-3-(tetrahydrofuran-2-yl)-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

A mixture of the title compound from example 61 (80mg, 0.16mmol) and
5 10% palladium on charcoal (10mg) in ethanol (4.5ml) and water (0.5ml)
was hydrogenated at 60 psi (414 kPa) and 40°C for 18 hours. The reaction
mixture was filtered through Celite®, and the filtrate evaporated under
reduced pressure to afford the title compound, (27mg, 32%).

δ (CDCl₃) : 1.01 (3H, t), 1.59 (3H, t), 2.15 (1H, m), 2.26 (1H, m), 2.40
10 (3H, m), 2.56 (4H, m), 2.86 (1H, m), 3.14 (4H, m), 3.98 (1H, m), 4.02
(1H, m), 4.20 (3H, s), 4.77 (2H, q), 5.36 (1H, m), 8.62 (1H, d), 9.00
(1H, d), 10.68 (1H, s).

LRMS : m/z 518 (M+1)⁺

15 Example 80

3-Ethoxy-5-[2-ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)-pyridin-3-yl]-2-methyl-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

Sodium nitrite (12mg, 0.18mmol) was added to a cooled (-10°C) solution
of the title compound of preparation 120 (40mg, 0.12mmol) in acetic acid
20 (0.45ml) and concentrated hydrochloric acid (0.45ml) and the solution
allowed to warm to 0°C over 2 hours. The solution was re-cooled to
-20°C, liquid sulphur dioxide (0.36ml) and a solution of copper (II)
chloride (48mg, 0.48mmol) in water (2ml) and acetic acid (1ml) added,
and the reaction then allowed to warm to room temperature over 2 hours.
25 The mixture was extracted with dichloromethane, the combined organic
extracts dried (Na₂SO₄), concentrated under reduced pressure and
azeotroped with toluene. The brown residue was dissolved in ethanol
(10ml), N-ethylpiperazine (50µl, 0.38mmol) added and the reaction stirred

at room temperature for 18 hours. The mixture was concentrated under reduced pressure and the crude product purified by column chromatography on silica gel using dichloromethane:methanol:0.88 ammonia (98:2:0.5) to give the title compound, (12mg, 20%).

5 δ (CDCl_3) : 1.02 (3H, t), 1.57 (6H, m), 2.41 (2H, q), 2.57 (4H, m), 3.12 (4H, m), 3.90 (3H, s), 4.74 (2H, q), 4.88 (2H, q), 8.60 (1H, d), 8.92 (1H, d), 10.56 (1H, s).

LRMS : m/z 492 ($M+1$)⁺

10 Example 81

5-[2-n-Butoxy-5-(4-ethylpiperazin-1-ylsulphonyl)pyridin-3-yl]-3-ethoxy-2-methyl-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

Potassium bis(trimethylsilyl)amide (10mg, 0.05mmol) was added to a suspension of the title compound of example 80 (10mg, 0.02mmol) in n-butanol (4ml), and the reaction mixture heated under reflux for 6 hours. The cooled mixture was evaporated under reduced pressure and the residue purified by column chromatography on silica gel using dichloromethane:methanol:0.88 ammonia (98:2:0.5) as eluant, to afford the title compound, (8mg, 76%).

20 δ (CDCl_3) : 1.02 (6H, t), 1.57 (5H, m), 1.96 (2H, m), 2.42 (2H, q), 2.56 (4H, m), 3.13 (4H, m), 3.90 (3H, s), 4.65 (2H, t), 4.88 (2H, q), 8.60 (1H, s), 8.90 (1H, s), 10.53 (1H, s).

LRMS : m/z 520 ($M+1$)⁺

Example 82

5-[2-Ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)-pyridin-3-yl]-3-(1-ethoxyvinyl)-2-methyl-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one

A mixture of the title compound or preparation 101 (100mg, 0.19mmol),
5 lithium chloride (80mg, 1.9mmol), copper (I) iodide (6mg, 0.03mmol)
and (1-ethoxyvinyl)(tri-n-butyl)stannane (90mg, 0.247mmol) in dioxan
(10ml) was de-gassed and placed under an atmosphere of nitrogen.
Tetrakis(triphenylphosphine)palladium (0) (20mg, 0.017mmol) was added,
and the reaction heated under reflux for 5 hours. The cooled mixture was
10 concentrated under reduced pressure, and the residue stirred vigorously in
a solution of ethyl acetate:10% aqueous potassium fluoride solution for 10
minutes. The resulting suspension was filtered through Arbocel®, and the
filtrate separated. The organic layer was washed with 10% aqueous
potassium fluoride solution, then brine, dried (MgSO₄) and evaporated
15 under reduced pressure. The crude product was purified by medium
pressure column chromatography on silica gel using an elution gradient of
dichloromethane:methanol (100:0 to 98:2) to afford the title compound
(84mg, 85%) as a foam.

δ (CDCl₃) : 1.02 (3H, t), 1.46 (3H, t), 1.58 (3H, t), 2.41 (2H, q), 2.57
20 (4H, m), 3.15 (4H, m), 4.02 (2H, q), 4.24 (3H, s), 4.69 (1H, d), 4.77
(2H, q), 5.23 (1H, d), 8.62 (1H, d), 9.06 (1H, d), 10.70 (1H, s).

LRMS : m/z 518 (M+1)⁺

Example 83

25 N,2-Dimethyl-5-[2-ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)pyridin-3-yl]-
7-oxo-6,7-dihydro-2H-pyrazolo[4,3-d]pyrimidine-3-carboxamide

A mixture of the title compound of preparation 159 (50mg, 0.108mmol),
acetyl chloride (7μl, 0.108mmol) and pyridine (9μl, 0.11mmol) in

dichloromethane (2ml) was stirred at room temperature for 18 hours. The reaction mixture was evaporated under reduced pressure and the residue purified by column chromatography on silica gel using an elution gradient of dichloromethane:methanol (100:0 to 80:20) to afford the title compound
5 (45mg, 82%).

δ (CDCl₃) : 1.08 (3H, m), 1.58 (3H, t), 2.38 (3H, s), 2.44-2.70 (6H, m), 3.18 (4H, m), 4.01 (3H, s), 4.74 (2H, q), 8.60 (1H, d), 8.95 (1H, d), 10.67 (1H, s).

Claims

1. A compound of formula IA, or of formula IB:

IA

IB

wherein

A represents CH or N;

R¹ represents H, lower alkyl, Het, alkylHet, aryl or alkylaryl, which latter five groups are all optionally substituted (and/or, in the case of lower alkyl, optionally terminated) by one or more substituents selected from halo, cyano, nitro, lower alkyl, OR⁵, C(O)R⁶, C(O)OR⁷, C(O)NR⁸R⁹, NR^{10a}R^{10b} and SO₂NR^{11a}R^{11b};

R² represents C(O)NR¹²R¹³, C(O)OR¹², NR¹²R¹³, N(H)SO₂R¹², N(H)SO₂NR¹²R¹³, N(H)C(O)R¹², OR^{12a}, lower alkyl (which alkyl group is interrupted by one or more of O, S or N(R¹²) and/or substituted or terminated by C(O)NR¹²R¹³, C(O)OR¹² or aryl or Het¹), cyano, aryl or Het¹;

R³, R¹² and R¹³ independently represent H or lower alkyl, which alkyl group is optionally substituted and/or optionally terminated by one or more substituents selected from aryl, Het, halo, cyano, nitro, OR⁵, C(O)R⁶, C(O)OR⁷, C(O)NR⁸R⁹, NR^{10a}R^{10b} and SO₂NR^{11a}R^{11b};

R⁴ represents SO₂NR¹⁴R¹⁵;

R¹⁴ and R¹⁵, together with the nitrogen to which they are attached, form Het;

Het represents an optionally substituted four- to twelve-membered heterocyclic group, which group contains at least one nitrogen atom and, optionally, one or more further heteroatoms selected from nitrogen, oxygen and sulphur;

Het¹ represents an optionally substituted four- to twelve-membered heterocyclic group, which group contains at least one nitrogen atom or at least one oxygen atom and, optionally, one or more further heteroatoms selected from nitrogen, oxygen and sulphur; and

R⁵, R⁶, R⁷, R⁸, R⁹, R^{11a}, R^{11b} and R^{12a} independently represent, at each occurrence when used herein, H or lower alkyl;

R^{10a} and R^{10b}, at each occurrence when used herein, either independently represent, H or lower alkyl or, together with the nitrogen atom to which they are attached, represent azetidiny, pyrrolidinyl or piperidinyl; or a pharmaceutically, or a veterinarily, acceptable derivative thereof.

2. A compound as claimed in Claim 1, wherein R¹ represents H, a linear, branched, cyclic, acyclic and/or part cyclic/acyclic lower alkyl group, alkylHet, or alkylaryl.

3. A compound as claimed in Claim 1 or Claim 2, wherein R² represents a linear or branched, optionally unsaturated lower alkyl group (which alkyl group is optionally interrupted by one or more of O, S or N(R¹²)), C(O)NR¹²R¹³, NR¹²R¹³, N(H)C(O)R¹², OR^{12a}, aryl or Het¹.

4. A compound as claimed in any one of the preceding claims, wherein R³ represents linear, branched, cyclic and/or acyclic lower alkyl

which is optionally substituted or terminated by one or more substituents selected from Het or OR⁵.

5 5. A compound as claimed in any one of the preceding claims, wherein R¹² and R¹³ independently represent H, or linear or branched lower alkyl, provided that, in the case where R² represents NR¹²R¹³, R¹² and R¹³ do not both represent H.

10 6. A compound as claimed in any one of the preceding claims, wherein R¹⁴ and R¹⁵, together with the nitrogen to which they are attached represent 4-R¹⁶-piperazinyl, in which R¹⁶ represents H or lower alkyl, which latter group is optionally substituted or terminated by one or more substituents selected from aryl, Het, halo, cyano, nitro, OR⁵, C(O)R⁶, C(O)OR⁷, C(O)NR⁸R⁹, NR^{10a}R^{10b}, SO₂NR^{11a}R^{11b} and N(H)SO₂R¹² wherein
15 R⁵, R⁶, R⁷, R⁸, R⁹, R^{10a}, R^{10b}, R^{11a}, R^{11b} and R¹² are as defined in Claim 1.

7. A compound as defined in any one of Claims 1 to 6 for use as a pharmaceutical.

20 8. A compound as defined in any one of Claims 1 to 6 for use as an animal medicament.

9. A formulation comprising a compound as defined in any one of Claims 1 to 6 in admixture with a pharmaceutically or veterinarily
25 acceptable adjuvant, diluent or carrier.

10. A formulation as claimed in Claim 9, which is a pharmaceutical formulation.

11. A formulation as claimed in Claim 9, which is a veterinary formulation.

5 12. The use of a compound as defined any one of Claims 1 to 6 for the manufacture of a medicament for the curative or prophylactic treatment of a medical condition for which inhibition of cGMP PDE5 is desired.

10 13. A method of treating or preventing a medical condition for which inhibition of cGMP PDE5 is desired, which comprises administering a therapeutically effective amount of a compound as defined in any one of Claims 1 to 6 to a patient in need of such treatment.

14. Use as claimed in Claim 12, or method as claimed in Claim 13,
15 wherein the condition is male erectile dysfunction, female sexual dysfunction, premature labour, dysmenorrhoea, benign prostatic hyperplasia (BPH), bladder outlet obstruction, incontinence, stable or unstable variant (Prinzmetal) angina, hypertension, pulmonary hypertension, congestive heart failure, atherosclerosis, stroke, peripheral
20 vascular disease, conditions of reduced blood vessel patency, chronic asthma, bronchitis, allergic asthma, allergic rhinitis, glaucoma, a disease characterised by disorders of gut motility, pre-eclampsia, Kawasaki's syndrome, nitrate tolerance, multiple sclerosis, peripheral diabetic neuropathy, stroke, Alzheimer's disease, acute respiratory failure,
25 psoriasis, skin necrosis, cancer metastasis, baldness, nutcracker oesophagus, anal fissure and hypoxic vasoconstriction.

15. A process for the preparation of a compound of formula IA, or of formula IB, as defined in Claim 1, which comprises:

(a) cyclisation of a corresponding compound of formula IIA, or of formula IIB, respectively:

IIA

IIB

wherein R^1 , R^2 , R^3 , R^4 and A are as defined in Claim 1;

(b) for compounds of formulae IA and IB, in which R^2 represents $C(O)NR^{12}R^{13}$, reaction of a corresponding compound of formula IA, or of formula IB, in which R^2 represents $C(O)OH$ (or a carboxylic acid derivative thereof) with a compound of formula

in which R^{12} and R^{13} are as defined in Claim 1;

(c) for compounds of formulae IA and IB, in which R^2 represents $C(O)OR^{12}$, cyclisation of a corresponding compound of formula VIA, or of formula VIB, respectively:

VIA

VIB

wherein R^1 , R^3 , R^4 and A are as defined in Claim 1, and R^{12alk} represents an optionally substituted lower alkyl group, followed by removal of the alkyl group R^{12alk} (if required) by hydrolysis, and/or (if required) exchange with a further optionally substituted alkyl group;

- 5 (d) reaction of a corresponding compound of formulae VIII A, or of formula VIII B, respectively:

VIII A

VIII B

- wherein Y is a leaving group, and R^1 , R^2 , R^3 and A are as defined in Claim 1, with a compound of formula IX:

wherein R^{14} and R^{15} are as defined in Claim 1;

- (e) for compounds of formulae IA and IB, in which R^1 represents lower alkyl, alkylHet or alkylaryl, alkylation of a corresponding compound of formula IA, or of formula IB, respectively, in which R^1 represents H;
- 15 (f) for compounds of formulae IA and IB, in which R^2 represents lower alkyl (which alkyl group is branched and unsaturated at the carbon atom that is attached to the rest of the molecule), $NR^{12}R^{13}$, cyano, aryl or Het¹ (which Het¹ group is either aromatic or unsaturated at the carbon atom that is attached to the rest of the molecule), cross-coupling of a corresponding
- 20 compound of formula XXIII A, or of formula XXIII B, respectively:

XXIIIA

XXIIIB

wherein Hal represents Cl, Br or I and R¹, R³, R⁴ and A are as defined in Claim 1, using a compound of formula

- 5 wherein R^{2a} represents lower alkyl (which alkyl group is branched and unsaturated at the carbon atom that is attached to M), NR¹²R¹³, cyano, aryl or Het¹ (which Het¹ group is either aromatic or unsaturated at the carbon atom that is attached to M), R¹² and R¹³ are as defined in Claim 1 and M represents an optionally substituted metal or boron group, which group is
10 suitable for cross-coupling reactions;

(g) for compounds of formulae IA and IB in which R² represents N(H)C(O)R¹², acylation of a corresponding compound of formula IA or IB in which R² represents NH₂, using a compound of formula XXVI,

- 15 in which L¹ represents a leaving group and R¹² is as defined in Claim 1;
(h) for compounds of formulae IA and IB in which R² represents NR¹²R¹³ in which one of R¹² and R¹³ does not represent H, alkylation of a corresponding compound of formula IA or IB in which R² represents NH₂;
(i) for compounds of formulae IA and IB in which R² represents NR¹²R¹³
20 in which one of R¹² and R¹³ does not represent H, reductive amination of a compound of formula IA or IB in which R² represents NH₂, using an appropriate carbonyl compound;

(j) for compounds of formulae IA and IB in which R^2 represents NH_2 , reduction of a corresponding compound of formula XXVIIA, or of formula XXVIIIB, respectively:

XXVIIA

XXVIIIB

- 5 wherein A, R^1 , R^3 and R^4 are as defined in Claim 1;
 - (k) conversion, removal or introduction of a substituent on an aryl, or a Het or Het¹, group in, or on the phenyl/pyridinyl, or pyrazolo, unit of, a compound of formula IA or IB;
 - (l) conversion of one R^3 group to another by alkoxide exchange;
 - 10 (m) for compounds of formula IA or IB in which R^{14} and R^{15} , together with the nitrogen to which they are attached, form a 4- R^{16} -piperazinyl group in which R^{16} represents alkyl, alkylation of a corresponding compound of formula IA or IB in which R^{16} represents hydrogen; or
 - (n) deprotection of a protected derivative of a compound of formula IA or
 - 15 of formula IB.
-
16. A compound of formula IIA, or formula IIB, as defined in Claim 15.
-
- 20 17. A compound of formula VIA, or formula VIB, is as defined in Claim 15.

18. A compound of formula VIIIA, or formula VIIB, as defined in Claim 15.
19. A compound of formula XXIIIA, or formula XXIIIB, as defined in
5 Claim 15.
20. A compound of formula XXVIIA, or formula XXVIIB, as defined in Claim 15.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/IB 99/01706

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 12-14
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claims 12 to 14
are directed to a method of treatment of the human/animal
body, the search has been carried out and based on the alleged
effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
